Front-end Development (Angular)

Личный кабинет / Мои курсы / Angular / HTML/CSS / TASK 1.4 Create Product List + Adaptive design

TASK 1.4 Create Product List + Adaptive design

Готово: Просмотреть Готово: Давать ответ на задание Готово: Получить оценку

1.

Font - Roboto - 300;
2.

One of the products is TOP DEAL - can only be one and always in the first position;
3.

If the goods are more than 5 (the number of special offers in the layout), they just continue on the next line that's displayed. Imagine the cards are rendered server - the number of cards and content in them can be different. Therefore, it should be very simple and nothing more needs to break and go.
4.

The card is a link. When you hover on the card, the border should become equal to 3px, product name becomes underlined (product name in the layout is "Stand mixer ...", the rest shouldn't be emphasized).
5.

Some cards have a timer, no need to do javascript logic for timer, let it be static, you must take into account that in addition to the hours of some of the goods may also be days like (23 days 01:23:00). Days are displayed on a separate line for hours at the height of the card should not be changed.
6.

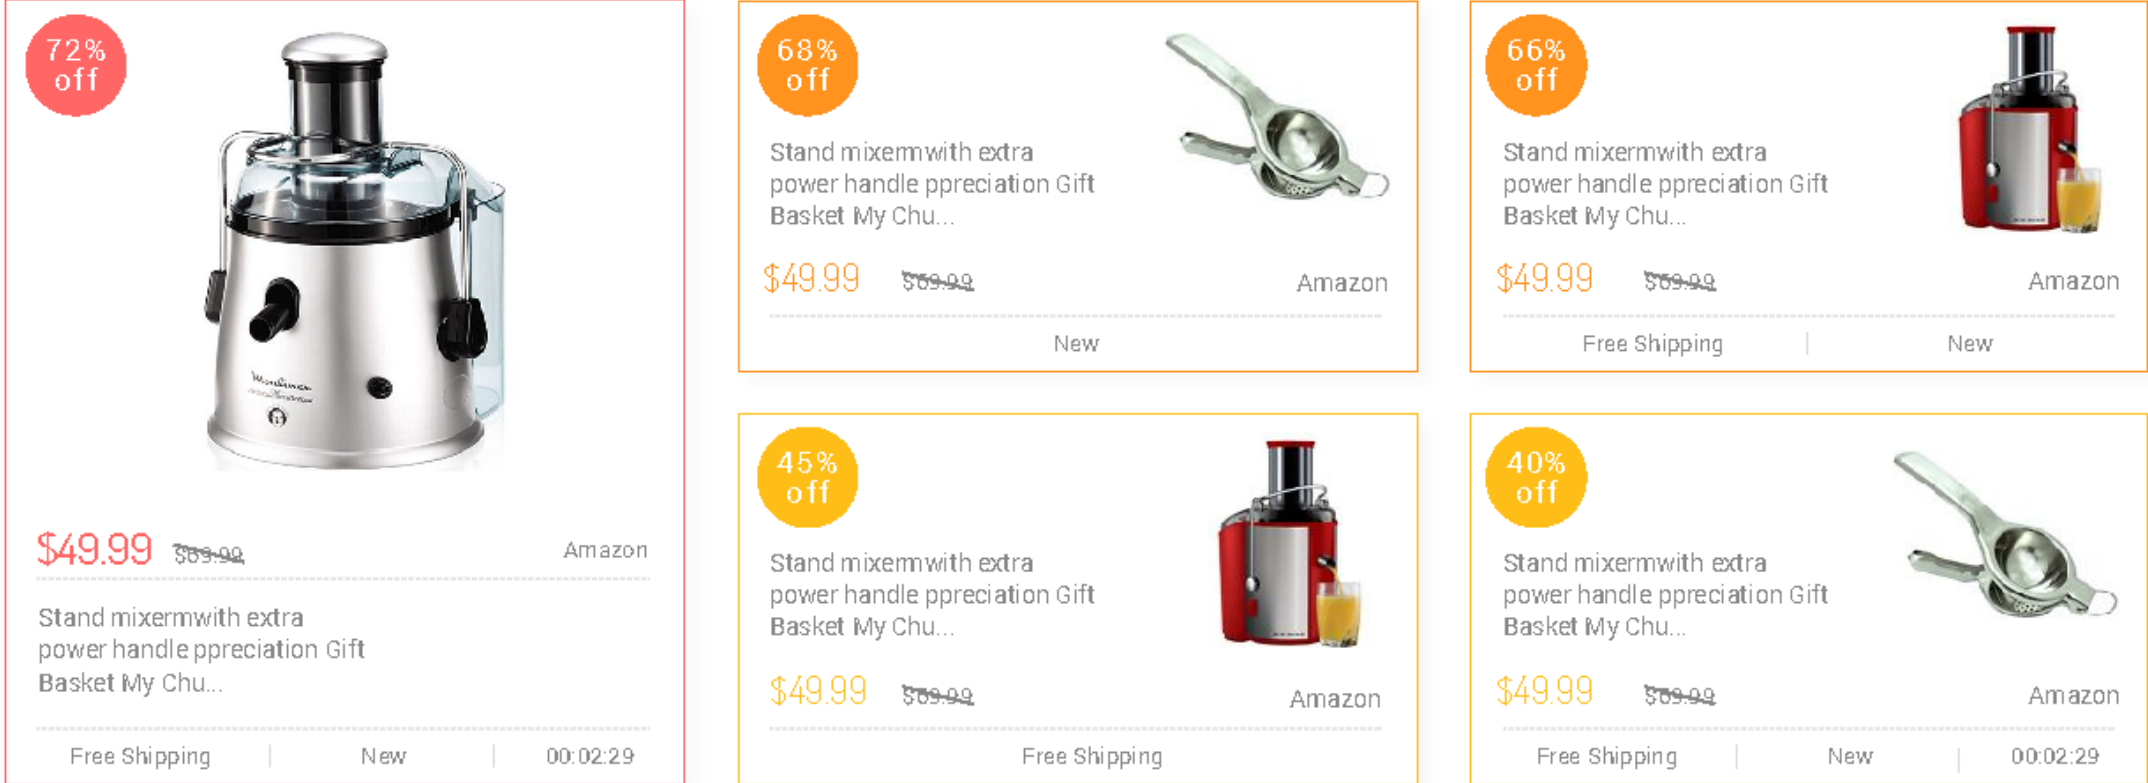

Imposition must be responsive - this is important for the sake of simplicity we take the standard graduation:
- a.

Large> 1200px (3) *
- b.

Middle> 992px (3)
- c.

Small> 768px (2)
- d.

Extra small <767px (1)
- * The figure refers to the number of cards in a row.
